the ratio of the volume at bottom dead center and the volume at top dead center. It is a key characteristics for many internal combustion engines. In the following section, it will be shown that the compression ratio determines the thermal efficiency of used thermodynamic cycle of the combustion engine.

Example - Heat Loss through a Wall. A major source of heat loss from a house is through walls. Calculate the rate of heat flux through a wall 3 m x 10 m in area ($A = 30 \text{ m}^2$). The wall is 15 cm thick ($L = 0.15 \text{ m}$) and it is made of bricks with the thermal conductivity of $k = 1.0 \text{ W/m.K}$ (poor thermal insulator). Assume that, the indoor and the outdoor temperatures are 22°C and -8°C , and the ...
